Regulates contracts by the state to buy radios for the 800-MHZ public safety radio system for use with the infrastructure system architecture and software of the system.

Requires the entity who holds the source code for the system architecture and software applications to furnish the source code to the commissioner of administration within 60 days of the bill's effective date in order to be eligible to bid on the radio contract. Allows the department to disclose the source code only to bidders on the contract who are signatories to a share technology agreement under the Association of Public Safety Commission Officers, and only to the extent needed to operate with the system's architecture. Designates the source code as a trade secret, which classifies it as nonpublic data.

Prohibits a state agency from:

1) awarding the radio contract if the radios to be purchased under the contract may only be operated using the software and equipment of the source code holder, or
2) issuing a request for bids for the contract until at least 90 days after the source code has been furnished to the commissioner of administration.

The act would be effective immediately.
